#### Abstract

Let $G=(V, E)$ be a connected graph. A subset $D$ of $V$ is called a dominating set if every vertex in $V-D$ is adjacent to some vertex in $D$. A dominating set $D$ of $G$ is called a neighborhood tree dominating set (ntr-set), if the induced subgraph $\langle\mathbf{N}(\mathrm{D})\rangle$ is a tree. The minimum cardinality of a ntr-set of $G$ is called the neighborhood tree domination number of $G$ and is denoted by $\gamma_{\text {ntr }}(G)$. The connectivity $\kappa(G)$ of $G$ is the minimum number of vertices whose removal results in a disconnected or trivial graph. A partition $\left\{V_{1}, V_{2}, V_{3}, \ldots, V_{n}\right\}$ of $V(G)$, in which each $V_{i}$ is a ntr - set in $G$ is called a neighborhood tree domatic partition of simply ntr partition of $G$. The maximum order of a ntr - partition of $G$ is called the neighborhood tree domatic number of $G$ and is denoted by $d_{n t r}(G)$.

In this paper, we find an upper bound for the sum of the neighborhood tree domination number and connectivity of a graph and to find bounds for $d_{\text {ntr }}(G)$ and its exact value for some particular classes of graphs are studied.

Keywords: Domination number, tree domination , neighborhood tree domination number, connectivity, domatic number. Subject classification: 05C69.

## INTRODUCTION

The graph $\mathrm{G}=(\mathrm{V}, \mathrm{E})$, we mean a finite, undirected, connected simple graph. The order and size of G are denoted by $n$ and $m$ respectively. The open neighborhood and the closed neighborhood of $\mathrm{v} \in \mathrm{V}$ are denoted by $\mathrm{N}(\mathrm{v})$ and $N[v]=N(v) \cup\{v\}$ respectively. If $D \subseteq V$, then $N(D)=\underset{v \in D}{U} N(v)$ and $N[D]=N(D) \cup D$.

The study of domination in graphs has found rapid growth in the recent years. It is a highly flourishing area of research in graph theory. So far, hundreds of research articles have appeared on this topic of research in view of its growing real life application.

A subset D of V is called a dominating set of G if $\mathrm{N}[\mathrm{D}]=\mathrm{V}$. The minimum cardinality of a minimal dominating set of G is called the domination number of G and is denoted by $\gamma(\mathrm{G})$. An excellent treatment of the fundamentals of domination is given in the book by Haynes et al. [4]. A survey of several advanced topics in domination is given in the book edited by Haynes et al. [5].

Xuegang Chen, Liang Sun and Alice McRac [8] introduced the concept of tree domination in graphs. A
dominating set $D$ of $G$ is called a tree dominating set, if the induced subgraph $\langle\mathrm{D}\rangle$ is tree. The minimum cardinality of a tree dominating set of $G$ is called the tree domination number of $G$ and is denoted by $\gamma_{\mathrm{tr}}(\mathrm{G})$. S. Arumugam and C. Sivagnanam introduced the concepts of neighborhood connected and neighborhood total domination in graphs[1,2]. A dominating set $D$ of $G$ is called a neighborhood connected dominating set (ncd-set), if the induced subgraph $\langle\mathrm{N}(\mathrm{D})\rangle$ is connected. The minimum cardinality of a ncd-set of G is called the neighborhood connected domination number of G and is denoted by $\gamma_{\mathrm{nc}}(\mathrm{G})$.

A dominating set D of G is called a neighborhood total dominating set, if the induced subgraph $\langle N(D)\rangle$ has no isolated vertices. The minimum cardinality of a ntd-set of G is called the neighborhood total domination number of G and is denoted by $\gamma_{\mathrm{ntd}}(\mathrm{G})$.

We introduced the concept of neighborhood tree dominating set in [6]. Zelinka[10] studied the connected domatic number of a graph. Chen et al. [9] studied the tree domatic number of a graph.

A dominating set D of a connected graph G is called a neighborhood tree dominating set(ntr-set), if the induced subgraph $\langle N(D)\rangle$ is a tree. The minimum

International Journal of Advanced Research Trends in Engineering and Technology (IJARTET) Vol. 5,Special Issue 12, April 2018
cardinality of a ntr-set of $G$ is called the neighborhood tree domination number of $G$ and is denoted by $\gamma_{\mathrm{ntr}}(\mathrm{G})$. The tree domatic number of G is the maximum number of pairwise disjoint tree dominating sets in $V(G)$ and is denoted by $\mathrm{d}_{\mathrm{tr}}(\mathrm{G})$.

A partition $\left\{V_{1}, V_{2}, V_{3}, \ldots, V_{n}\right\}$ of $V(G)$, in which each $V_{i}$ is a ntr - set in G is called a neighborhood tree domatic partition of simply ntr partition of G. the maximum order of a ntr partition of $G$ is called the neighborhood tree domatic number of $G$ and is denoted by $d_{\text {ntr }}(G)$. The connectivity $\kappa(G)$ of $G$ is the minimum number of vertices whose removal results in a disconnected or trivial graph.

In this paper, we find an upper bound for the sum of the neighborhood tree domination number and connectivity of a graph and to find bounds for $d_{n t r}(G)$ and its exact value for some particular classes of graphs are studied.

## 2. PRIOR RESULTS

THEOREM: 2.1[6] Let G be a connected graph on $\mathrm{n} \geq 3$ vertices. Then $0 \leq \gamma_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}-1$ and $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ iff $\mathrm{G} \cong \mathrm{P}_{3}$.

THEOREM: $2.2[1]$ For any graph $\mathrm{G}, \kappa(\mathrm{G}) \leq \delta(\mathrm{G})$.

## 3. MAIN RESULTS

THEOREM: 3.1 For any connected graph $G$ with $n$ vertices, $\gamma_{\mathrm{nrr}}(\mathrm{G})+\kappa(\mathrm{G}) \leq 2 \mathrm{n}-3, \mathrm{n} \geq 3$.

## PROOF:

By theorem 2.1 and 2.2,
$\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G}) \leq \mathrm{n}-1+\delta(\mathrm{G}) \leq \mathrm{n}-1+\mathrm{n}-1 \leq 2 \mathrm{n}$ -2 .
If $\gamma_{\mathrm{nrr}}(\mathrm{G})+\kappa(\mathrm{G})=2 \mathrm{n}-2$, then the following cases are to be considered.
(i) $\quad \gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}$ and $\kappa(\mathrm{G})=\mathrm{n}-2$.
(ii) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ and $\kappa(\mathrm{G})=\mathrm{n}-1$

Since $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}-1$ the case (ii) alone be considered. But $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ iff $\mathrm{G} \cong \mathrm{P}_{3}$ and $\kappa\left(\mathrm{P}_{3}\right)=1 \neq$ $\mathrm{n}-1$.Therefore, there is no connected graph G with $\gamma_{\mathrm{ntr}}(\mathrm{G})$ $+\kappa(\mathrm{G})=2 \mathrm{n}-2$. Hence, $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G}) \leq 2 \mathrm{n}-3, \mathrm{n} \geq 3$.

THEOREM: 3.2 Let $G$ be a connected graph. Then $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=2 \mathrm{n}-3(\mathrm{n} \geq 3)$ if and only if $G$ is isomorphic to one of the graphs $\mathrm{C}_{3}$ and $\mathrm{P}_{3}$.

PROOF:

If $\mathrm{G} \cong \mathrm{P}_{3}$ then $\gamma_{\mathrm{ntr}}(\mathrm{G})=2$ and $\kappa(\mathrm{G})=1$ and hence $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=3=2 \mathrm{n}-3$.

If $\mathrm{G} \cong \mathrm{C}_{3}$ then $\gamma_{\mathrm{ntr}}(\mathrm{G})=1$ and $\kappa(\mathrm{G})=2$ and $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=3=2 \mathrm{n}-3$.

Conversely, assume $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=2 \mathrm{n}-3$, for
$\mathrm{n} \geq 3$. Then the following cases are to considered.
(i) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}$ and $\kappa(\mathrm{G})=\mathrm{n}-3$
(ii) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ and $\kappa(\mathrm{G})=\mathrm{n}-2$
(iii) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-2$ and $\kappa(\mathrm{G})=\mathrm{n}-1$.
$\operatorname{Case}(\mathrm{i}): \gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}$ and $\kappa(\mathrm{G})=\mathrm{n}-3$.
Since for any connected graph $G, \gamma_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}-1$, this case is not possible.

Case(ii): $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ and $\kappa(\mathrm{G})=\mathrm{n}-2$
$\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ if and only if $\mathrm{G} \cong \mathrm{P}_{3}$ and $\kappa\left(\mathrm{P}_{3}\right)=1=$ $\mathrm{n}-2$. Therefore $\mathrm{G} \cong \mathrm{P}_{3}$.

Case(iii): $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-2$ and $\kappa(\mathrm{G})=\mathrm{n}-1$.
If $\kappa(G)=n-1$, then $G \cong K_{n}, n \geq 3$. But $\gamma_{\mathrm{ntr}}(G)=0$
for $\mathrm{G} \cong \mathrm{K}_{\mathrm{n}}, \mathrm{n} \geq 4$. Therefore, $\mathrm{G} \cong \mathrm{K}_{3}$ (or) $\mathrm{C}_{3}$. Also $\gamma_{\mathrm{ntr}}\left(\mathrm{C}_{3}\right)=$ $1=n-2$.
Therefore, from case(ii) and case(iii), $\mathrm{G} \cong \mathrm{P}_{3}$ (or) $\mathrm{C}_{3}$.
THEOREM: 3.3 There is no connected graph $G$ with $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=2 \mathrm{n}-4$, where $\mathrm{n} \geq 3$.

## PROOF:

Assume $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=2 \mathrm{n}-4, \mathrm{n} \geq 3$. Then the following cases are to be considered.
(i) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}$ and $\kappa(\mathrm{G})=\mathrm{n}-4$
(ii) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ and $\kappa(\mathrm{G})=\mathrm{n}-3$
(iii) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-2$ and $\kappa(\mathrm{G})=\mathrm{n}-2$
(iv) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-3$ and $\kappa(\mathrm{G})=\mathrm{n}-1$

There is no connected graph G with $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}, \kappa(\mathrm{G})=\mathrm{n}-$ 4 and $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1, \kappa(\mathrm{G})=\mathrm{n}-3$.

Case(iii): $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-2=\kappa(\mathrm{G})$
Since $\kappa(\mathrm{G}) \leq \delta(\mathrm{G}), \delta(\mathrm{G}) \geq \mathrm{n}-2$.
(a) If $\delta(\mathrm{G})>\mathrm{n}-2$, then $\mathrm{G} \cong \mathrm{K}_{\mathrm{n}}, \mathrm{n} \geq 3$. But $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$ for $\mathrm{G} \cong \mathrm{K}_{\mathrm{n}}, \mathrm{n} \geq 4$. Therefore, $\mathrm{G} \cong \mathrm{K}_{3}$, and $\kappa\left(\mathrm{K}_{3}\right)=2 \neq \mathrm{n}-2$.
(b) Assume $\delta(\mathrm{G})=\mathrm{n}-2$. Then G is isomorphic to $K_{n}-Y$ where $Y$ is a matching in $K_{n}, n \geq 3$ and $\gamma_{\text {ntr }}(G) \leq 2$.If $\gamma_{\mathrm{ntr}}(\mathrm{G})=2=\mathrm{n}-2$ then $\mathrm{n}=4$.Therefore, $\mathrm{G} \cong \mathrm{K}_{4}-\mathrm{e}, \mathrm{C}_{4}$. If $\mathrm{G} \cong \mathrm{C}_{4}$, then $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$. If $\mathrm{G} \cong \mathrm{K}_{4}-\mathrm{e}$, then $\gamma_{\mathrm{ntr}}(\mathrm{G})=1 \neq \mathrm{n}-$ 2. If $\gamma_{\mathrm{ntr}}(\mathrm{G})<2$, then $\mathrm{n}-2<2$. That is, $\mathrm{n} \leq 3$. Therefore $\mathrm{n}=3$ and $\mathrm{G} \cong \mathrm{P}_{3}$ (or) $\mathrm{C}_{3}$. If $\mathrm{G} \cong \mathrm{P}_{3}$, $\gamma_{\mathrm{ntr}}\left(\mathrm{P}_{3}\right)=\mathrm{n}-1$. If $\mathrm{G} \cong \mathrm{C}_{3}, \kappa\left(\mathrm{C}_{3}\right)=2 \neq \mathrm{n}-2$.

Case(iv): $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-3$ and $\kappa(\mathrm{G})=\mathrm{n}-1$
If $\delta(\mathrm{G})=\mathrm{n}-1$, then $\mathrm{G} \cong \mathrm{K}_{\mathrm{n}}, \mathrm{n} \geq 3$. But $\gamma_{\mathrm{ntr}}\left(\mathrm{K}_{\mathrm{n}}\right)=$
0 for $\mathrm{n} \geq 4$. Therefore, $\mathrm{G} \cong \mathrm{K}_{3}$ and $\gamma_{\mathrm{ntr}}(\mathrm{G})=\gamma_{\mathrm{ntr}}\left(\mathrm{K}_{3}\right)=1$ $\neq \mathrm{n}-3$. Therefore, there is no connected graph G with $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=2 \mathrm{n}-4$.

THEOREM: 3.4 For any connected graph $\mathrm{G}, \gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})$ $=2 n-5(n \geq 4)$ if and only if $G \cong K_{4}-e, K_{5}-\left\{e_{1}, e_{2}\right\}$.

## PROOF:

Assume $\gamma_{\mathrm{ntr}}(\mathrm{G})+\kappa(\mathrm{G})=2 \mathrm{n}-5$, then the following cases are to be considered.
(i) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}$ and $\kappa(\mathrm{G})=\mathrm{n}-5$
(ii) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-1$ and $\kappa(\mathrm{G})=\mathrm{n}-4$
(iii) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-2$ and $\kappa(\mathrm{G})=\mathrm{n}-3$
(iv) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-3$ and $\kappa(\mathrm{G})=\mathrm{n}-2$
(v) $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-4$ and $\kappa(\mathrm{G})=\mathrm{n}-1$

There is no connected graph G satisfying (i), (ii), and (v).
$\kappa\left(\mathrm{K}_{4}-\mathrm{e}\right)=1 \neq \mathrm{n}-2$. Therefore, $\mathrm{G} \cong \mathrm{P}_{4}$. If $\gamma_{\mathrm{ntr}}(\mathrm{G})<2$, then $\mathrm{n} \leq 3$. But $\mathrm{n} \geq 4$. Therefore, $\delta(\mathrm{G})=\mathrm{n}-3$.

Let $X=\left\{v_{1}, v_{2}, v_{3}, \ldots, v_{n-3}\right\}$ be a vertex cut of $G$ and $V-X=\left\{x_{1}, x_{2}, x_{3}\right\}$.

Subcase: $3.1\langle\mathrm{~V}-\mathrm{X}\rangle \cong \overline{K_{a}}$
Since $\delta(\mathrm{G})=\mathrm{n}-3$, each vertex in $\mathrm{V}-\mathrm{X}$ is adjacent to all the vertices of X .
(1)Assume $\mathrm{E}(\langle X\rangle)=\phi$. If $|X| \geq 4$, then $\langle X\rangle$ contains atleast one edge. Therefore, $|X| \leq 3$. Hence, $\mathrm{G} \cong \mathrm{K}_{3,3}, \mathrm{~K}_{2,3}$ or $\mathrm{K}_{1,3}$. But $\gamma_{\mathrm{ntr}}\left(\mathrm{K}_{3,3}\right)=\gamma_{\mathrm{ntr}}\left(\mathrm{K}_{2,3}\right)=0$. Therefore, $\mathrm{G} \cong \mathrm{K}_{1,3}$.
(2) Let $\mathrm{E}(\langle X\rangle) \neq \phi$. Let $\langle X\rangle$ contains exactly one edge say $\left(v_{1}, v_{2}\right) \in E(\langle X\rangle)$. Then $\left\{v_{1}, v_{2}, \ldots, v_{n-3}\right\}$ is a ntr set of $G$ and hence $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}-4$. If $\langle X\rangle$ is a tree, then $\mathrm{V}-\mathrm{X}$ is a ntr - set of G and hence $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq|\mathrm{V}-\mathrm{X}|=3$.

That is., $n-2 \leq 3 \Rightarrow n \leq 5$ and hence $|X| \leq 2$. If $|X|=2$, then $G \cong K_{2}+3 K_{1}$.If $|X|=2$, then $G \cong K_{1,3}$. If $|X|$ contains atleast two edge and $\langle\mathrm{X}\rangle$ is not a tree, then $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$.

Case (iii): $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-2$ and $\kappa(\mathrm{G})=\mathrm{n}-3$
Then $\delta(\mathrm{G}) \geq \mathrm{n}-3$, since $\kappa(\mathrm{G}) \leq \delta(\mathrm{G})$. If $\delta(\mathrm{G})=$ $\mathrm{n}-1$, then $\mathrm{G} \cong \mathrm{K}_{\mathrm{n}}, \mathrm{n} \geq 4$. But $\gamma_{\mathrm{ntr}}\left(\mathrm{K}_{\mathrm{n}}\right)=0$ for $\mathrm{n} \geq 4$. If $\delta(\mathrm{G})$ $=n-2$, then $G$ is isomorphic to $K_{n}-Y$, where $Y$ is matching in $\mathrm{K}_{\mathrm{n}}$. Then $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq 2$. If $\gamma_{\mathrm{ntr}}(\mathrm{G})=2$, then $\mathrm{n}=4$. Therefore $\mathrm{K}_{4}-\mathrm{e}, \mathrm{C}_{4}$. If $\mathrm{G} \cong \mathrm{C}_{4}, \gamma_{\mathrm{ntr}}\left(\mathrm{C}_{4}\right)=0$.If $\mathrm{G} \cong \mathrm{K}_{4}-\mathrm{e}$,

Sub case: $3.2\langle\mathrm{~V}-\mathrm{X}\rangle \cong \mathrm{K}_{2} \cup \mathrm{~K}_{1}$.
Let $\left(x_{1}, x_{2}\right) \in E(G)$. Since $\delta(G)=n-3, x_{3}$ is adjacent to all the vertices in X . That is, $\mathrm{d}\left(\mathrm{x}_{3}\right)=\mathrm{n}-3$.
(1) $\mathrm{E}(\langle\mathrm{X}\rangle)=\phi$. Therefore, $\mathrm{d}\left(\mathrm{v}_{\mathrm{i}}\right) \leq 3, \mathrm{i}=1,2, \ldots, \mathrm{n}-3$.

Vol. 5,Special Issue 12, April 2018

$$
\Rightarrow \delta(\mathrm{G}) \leq \mathrm{d}\left(\mathrm{v}_{\mathrm{i}}\right) \leq 3 \Rightarrow \mathrm{n}-3 \leq
$$

$3 \Rightarrow \mathrm{n} \leq 6$ $\Rightarrow|X| \leq 3$.
(a) $|\mathrm{X}|=3$. Then $|\mathrm{V}(\mathrm{G})|=6$ and $\delta(\mathrm{G})=\mathrm{n}-3 \leq 3$. Each vertex in X is adjacent to all the vertices of $\mathrm{V}-\mathrm{X}$. If $\mathrm{G} \cong \mathrm{G}_{1}$, then $\gamma_{\mathrm{ntr}}\left(\mathrm{G}_{1}\right)=2 \neq \mathrm{n}-2$.
(b) $|\mathrm{X}|=2$. Then $|\mathrm{V}(\mathrm{G})|=5$ and $\delta(\mathrm{G})=\mathrm{n}-3 \leq 2$. If $\mathrm{G} \cong \mathrm{G}_{2}$ and $\mathrm{d}\left(\mathrm{x}_{1}\right)=\mathrm{d}\left(\mathrm{x}_{2}\right)=3$ and $\mathrm{d}\left(\mathrm{x}_{3}\right)=2$ and then $\gamma_{\mathrm{ntr}}\left(\mathrm{G}_{2}\right)=2 \neq \mathrm{n}-2$. If $\mathrm{G} \cong \mathrm{G}_{3}$ and $\mathrm{d}\left(\mathrm{x}_{1}\right)=3$ and $\mathrm{d}\left(\mathrm{x}_{2}\right)=\mathrm{d}\left(\mathrm{x}_{3}\right)=2$ and then $\gamma_{\mathrm{ntr}}\left(\mathrm{G}_{3}\right)=2 \neq \mathrm{n}-2$. If $\mathrm{G} \cong \mathrm{G}_{4}$ and $\mathrm{d}\left(\mathrm{x}_{1}\right)=\mathrm{d}\left(\mathrm{x}_{2}\right)=\mathrm{d}\left(\mathrm{x}_{3}\right)=2$ and then $\gamma_{\mathrm{ntr}}\left(\mathrm{G}_{4}\right)=0$.
(c) $|\mathrm{X}|=1$. Then $|\mathrm{V}(\mathrm{G})|=4$ and $\delta(\mathrm{G})=\mathrm{n}-3 \leq 1$. If $\mathrm{G} \cong \mathrm{G}_{5}$ and $\mathrm{d}\left(\mathrm{x}_{1}\right)=\mathrm{d}\left(\mathrm{x}_{2}\right)=2$ and $\mathrm{d}\left(\mathrm{x}_{3}\right)=1$ and then $\gamma_{\mathrm{ntr}}\left(\mathrm{G}_{5}\right)=2=\mathrm{n}-2$.
(2). $\mathrm{E}(\langle\mathrm{X}\rangle) \neq \phi$. Since $\delta(\mathrm{G})=\mathrm{n}-3, \mathrm{~d}\left(\mathrm{x}_{1}\right), \mathrm{d}\left(\mathrm{x}_{2}\right) \geq \mathrm{n}-3$. Therefore, $x_{1}, x_{2}$ are adjacent to atleast $(n-4)$ vertices of $\mathrm{v}_{1}, \mathrm{v}_{2}, \mathrm{v}_{3}, \ldots, \mathrm{v}_{\mathrm{n}-3}$. Let $\mathrm{d}\left(\mathrm{x}_{1}\right)=\mathrm{d}\left(\mathrm{x}_{2}\right)=\mathrm{n}-2$. If $\langle\mathrm{X}\rangle$ contains an edge, then any dominating set $D$ of $G$ containing $(\mathrm{n}-2)$ vertices, $\langle\mathrm{N}(\mathrm{D})\rangle$ contains a cycle and hence $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$. Let $\mathrm{d}\left(\mathrm{x}_{1}\right)=\mathrm{d}\left(\mathrm{x}_{2}\right)=\mathrm{n}-3$ and $\left(\mathrm{v}_{\mathrm{n}-4}, \mathrm{v}_{\mathrm{n}-3}\right)$ $\in E(G)$. Let $x_{1}$ be adjacent to $v_{1}, v_{2}, v_{3}, \ldots, v_{n-4}$. Then $\left\{v_{1}\right.$, $\left.\mathrm{v}_{2}, \mathrm{v}_{3}, \ldots, \mathrm{v}_{\mathrm{n}-4}\right\}$ is a ntr-set of G and $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}-4$. Let $\mathrm{d}\left(\mathrm{x}_{1}\right)=\mathrm{n}-2, \mathrm{~d}\left(\mathrm{x}_{2}\right)=\mathrm{n}-3$ and let $\mathrm{x}_{2}$ be non adjacent to $v_{n-3}$. Then $\left\{v_{1}, v_{2}, v_{3}, \ldots, v_{n-4}\right\}$ is a ntr-set of $G$ and $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}-4$. If $\langle\mathrm{X}\rangle$ contains atleast two edges then $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$.

Sub case: $3.3\langle\mathrm{~V}-\mathrm{X}\rangle \cong \mathrm{P}_{3}$
(1) If $\mathrm{E}(\langle\mathrm{X}\rangle)=\phi$, then X is an ntr-set of G and hence $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq|\mathrm{X}|=\mathrm{n}-3$.
(2) If $\mathrm{E}(\langle\mathrm{X}\rangle) \neq \phi$, and if $\langle\mathrm{X}\rangle$ contains exactly one edge, then $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}-4$. If $\mathrm{E}(\langle X\rangle) \neq \phi$, and if $\langle X\rangle$ contains exactly two edge, then $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$.

Sub case: $3.4\langle\mathrm{~V}-\mathrm{X}\rangle \cong \mathrm{C}_{3}$
Then any dominating set D of G containing $(\mathrm{n}-2)$ vertices contain a cycle and hence $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$.
case (iv): $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}-3$ and $\kappa(\mathrm{G})=\mathrm{n}-2$
Therefore, $\delta(G) \geq n-2$. If $\delta(G)=n-1$, then $G \cong K_{n}, n \geq 4$. But $\gamma_{\mathrm{nrr}}\left(\mathrm{K}_{\mathrm{n}}\right)=0, \mathrm{n} \geq 4$. Let $\delta(\mathrm{G})=\mathrm{n}-2$. Then G is isomorphic to $K_{n}-Y$, where $Y$ is a matching in $G, n \geq 4$ and $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq 2$. If $\gamma_{\mathrm{ntr}}(\mathrm{G})=2$, then $\mathrm{n}=5$. Therefore, $\mathrm{G} \cong \mathrm{K}_{5}-\mathrm{e}$ (or) $\mathrm{K}_{5}-\left(\mathrm{e}_{1}, \mathrm{e}_{2}\right)$, where ( $\left.\mathrm{e}_{1}, \mathrm{e}_{2}\right)$ is a matching. If $\mathrm{G} \cong \mathrm{K}_{5}-\mathrm{e}$, then $\gamma_{\mathrm{ntr}}(\mathrm{G})=0$. If $\mathrm{G} \cong \mathrm{K}_{5}-\left(\mathrm{e}_{1}, \mathrm{e}_{2}\right)$, then $\gamma_{\mathrm{ntr}}(\mathrm{G})=2=\mathrm{n}-3$ and $\kappa(\mathrm{G})=3=\mathrm{n}-2$. If $\gamma_{\mathrm{ntr}}(\mathrm{G})=1$, then $\mathrm{n}=4$. Therefore,
$\mathrm{G} \cong \mathrm{K}_{4}-\mathrm{e}, \mathrm{C}_{4}$. But $\gamma_{\mathrm{ntr}}\left(\mathrm{C}_{4}\right)=0$. If $\mathrm{G} \cong \mathrm{K}_{4}-\mathrm{e}$, then $\gamma_{\mathrm{ntr}}(\mathrm{G})=1=\mathrm{n}-3$ and $\kappa(\mathrm{G})=2=\mathrm{n}-2$.

## 4. NEIGHBORHOOD TREE DOMATIC NUMBER

In this section we define a new parameter known as neighborhood tree domatic partition of a given graph and study that parameter.

## DEFINITION: 4.1

A domatic partition of $G$ is a partition $\left\{\mathrm{V}_{1}, \mathrm{~V}_{2}\right.$, $\left.V_{3}, \ldots, V_{n}\right\}$ of $V(G)$, in which each $V_{i}$ is a dominating set of G . The maximum order of a domatic partition of $G$ is called the domatic number of $G$ and is denoted by $d(G)$.

## DEFINITION: 4.2

A partition $\left\{\mathrm{V}_{1}, \mathrm{~V}_{2}, \mathrm{~V}_{3}, \ldots, \mathrm{~V}_{\mathrm{n}}\right\}$ of $\mathrm{V}(\mathrm{G})$, in which each $\mathrm{V}_{\mathrm{i}}$ is a ncd - set in G is called a neighborhood connected domatic partition of simply ncd partition of G. the maximum order of a ncd partition of $G$ is called the neighborhood connected domatic number of $G$ and is denoted by $\mathrm{d}_{\mathrm{ncd}}(\mathrm{G})$.

## DEFINITION: 4.3

A partition $\left\{V_{1}, V_{2}, V_{3}, \ldots, V_{n}\right\}$ of $V(G)$, in which each $\mathrm{V}_{\mathrm{i}}$ is a ntr-set in G is called a neighborhood tree domatic partition of simply ntr partition of G. the maximum order of a ntr partition of $G$ is called the neighborhood tree domatic number of G and is denoted by $\mathrm{d}_{\mathrm{ntr}}(\mathrm{G})$.

## EXAMPLE: 4.1

$$
D_{1}=\left\{v_{1}, v_{4}\right\}, v-D_{1}=\left\{v_{2}, v_{3}\right\}
$$

$$
\mathrm{D}_{2}=\left\{\mathrm{v}_{2}, \mathrm{v}_{3}\right\}, \mathrm{d}_{\mathrm{ntr}}(\mathrm{G})=2
$$

## REMARKS:

a) If $\mathrm{G} \cong \mathrm{C}_{3}$, then $\mathrm{d}_{\mathrm{t}}(\mathrm{G})=\mathrm{d}_{\mathrm{ntr}}(\mathrm{G})=\kappa(\mathrm{G})$ where $\kappa(\mathrm{G})$ is the connectivity of $G$.
b) Since any tree domatic partition of G is a ntr domatic partition, we have $\mathrm{d}_{\mathrm{tr}}(\mathrm{G}) \leq \mathrm{d}_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{d}(\mathrm{G})$.

Vol. 5,Special Issue 12, April 2018
c) Let $v \in V(G)$ and $d(v)=\delta$. Since
any ntr - set of $G$ must contains either $v$ (or) neighbor of v , it follows that $\mathrm{d}_{\mathrm{ntr}}(\mathrm{G}) \leq \delta(\mathrm{G})+1$.

EXAMPLE 4.2:

$\mathrm{d}_{\mathrm{ntr}}(\mathrm{G}) \leq \delta(\mathrm{G})+1=3$

$$
\mathrm{d}_{\mathrm{t}}(\mathrm{G})=\mathrm{d}_{\mathrm{ntr}}(\mathrm{G})=\kappa(\mathrm{G})=3
$$

Now we give some observations, theorems relating neighborhood tree domatic numbers of some classes of graphs.

Observation: 4.1
If $\left\{\mathrm{V}_{1}, \mathrm{~V}_{2}, \ldots, \mathrm{Vd}_{\mathrm{ntr}}\right\}$ is a neighborhood tree domatic partition of $G$. Since $\left|V_{k}\right| \geq \gamma_{\mathrm{ntr}}$ for each $k$, it follows that $\gamma_{\mathrm{ntr}}(\mathrm{G})$. $\mathrm{d}_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{n}$.

## EXAMPLE 4.3:

If $G \cong G_{1}$ o $K_{1}$, where $G_{1}$ is any tree then $d_{n t r}(G)=$ 2 and $\gamma_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n} / 2$ an hence $\gamma_{\mathrm{ntr}}(\mathrm{G}) . \mathrm{d}_{\mathrm{ntr}}(\mathrm{G})=\mathrm{n}$.

## THEOREM : 4.1

For any connected graph $G,\lfloor d(G) / 2\rfloor \leq d_{\text {ntr }}(G) \leq$ $\mathrm{d}(\mathrm{G})$ and the bounds are sharp.

## PROOF:

Since every neighborhood tree dominating set, we have $\mathrm{d}_{\mathrm{ntr}}(\mathrm{G}) \leq \mathrm{d}(\mathrm{G})$. Further, since the union of two disjoint dominating sets is a neighborhood tree dominating set, we have , $\lfloor\mathrm{d}(\mathrm{G}) / 2\rfloor \leq \mathrm{d}_{\text {ntr }}(\mathrm{G})$.

Also for the graphs $G \cong P_{3}, K_{1, n-1}, J_{m, n}, T_{n}$., $\lfloor\mathrm{d}(\mathrm{G}) / 2\rfloor=\mathrm{d}_{\mathrm{ntr}}(\mathrm{G})$. For the graph $\mathrm{G}=\mathrm{K}_{3}$, $\mathrm{d}_{\mathrm{ntr}}(\mathrm{G})=\mathrm{d}(\mathrm{G})=3$.

## THEOREM: 4.2

If $\gamma_{\mathrm{ntr}}(\mathrm{G})>0$, then $\mathrm{d}_{\mathrm{ntr}}(\mathrm{G}) \leq \frac{\mathrm{n}}{\gamma_{\mathrm{ntr}}(\mathrm{G})}$ and the bound is sharp.

PROOF:
$\operatorname{Let}\left\{D_{1}, D_{2}, \ldots, D_{k}\right\}$ is a partition of $V(G)$ into $k$ neighborhood tree dominating sets, such thatb, $\mathrm{d}_{\mathrm{ntr}}(\mathrm{G})=\mathrm{k}$. Since each $\left\langle\mathrm{N}\left(\mathrm{D}_{\mathrm{i}}\right)\right\rangle$ is a neighborhood tree dominating set, it follows that , $\gamma_{\mathrm{ntr}}(\mathrm{G}) \leq\left|\mathrm{D}_{\mathrm{i}}\right|$ for $1 \leq \mathrm{i} \leq \mathrm{k}$.

$$
\text { Thus, } \mathrm{n}=\sum_{1 \leq i \leq \mathrm{k}}\left|\mathrm{D}_{\mathrm{i}}\right| \geq \gamma_{\mathrm{ntr}}(\mathrm{G}) \cdot \mathrm{k}
$$

## THEOREM: 4.3

For the path $P_{n}(n \geq 4)$, we have $\mathrm{d}_{\mathrm{ntr}}\left(\mathrm{P}_{\mathrm{n}}\right)=\left\{\begin{array}{lll}1 & \text { if } & \mathrm{n} \text { is odd } \\ 2 & \text { if } & \mathrm{n} \text { is even }\end{array}\right.$
PROOF:

$$
\text { Let } V\left(P_{n}\right)=\left\{v_{1}, v_{2}, v_{3}, \ldots, v_{n}\right\} .
$$

If n is odd, $\mathrm{V}\left(\mathrm{P}_{\mathrm{n}}\right)$ is the only $\mathrm{ntr}-$ set. Suppose n is even, it follows from remarks that $\mathrm{d}_{\text {ntr }}\left(\mathrm{P}_{\mathrm{n}}\right) \leq 2$.
Now, let

Then $\left\{\mathrm{V}_{1}, \mathrm{~V}-\mathrm{V}_{1}\right\}$ is a ntr- domatic partition of $\mathrm{P}_{\mathrm{n}}$ and hence $\mathrm{d}_{\mathrm{ntr}}\left(\mathrm{P}_{\mathrm{n}}\right)=2$.

Observation 4.2:
For the cycle $C_{n}(n \geq 3)$, we have $d_{n t r}\left(C_{n}\right)=\left\{\begin{array}{ccc}3 & \text { if } & n=3 \\ 2 & \text { if } & n=4 k+2, k \geq 1\end{array}\right.$

Observation 4.3: $\mathrm{d}_{\mathrm{ntr}}\left(\mathrm{K}_{1, \mathrm{n}-1}\right)=1, \mathrm{n} \geq 3$.
Observation 4.4: $\mathrm{d}_{\mathrm{ntr}}\left(\mathrm{S}_{\mathrm{m}, \mathrm{n}}\right)=2, \mathrm{~m}, \mathrm{n} \geq 1$.
Observation 4.5: $\mathrm{d}_{\mathrm{ntr}}\left(\mathrm{P}_{\mathrm{n}} \bullet \mathrm{K}_{1}\right)=2, \mathrm{n} \geq 2$.
Observation 4.6: $\mathrm{d}_{\mathrm{ntr}}\left(\mathrm{P}_{\mathrm{n}}+\mathrm{K}_{1}\right)=3, \mathrm{n} \geq 2$.
Observation 4.7: $\mathrm{d}_{\mathrm{ntr}}\left(\overline{\boldsymbol{P}_{n}}\right)=\left\{\begin{array}{lll}2 & \text { if } & \mathrm{n}=4 \\ 0 & \text { if } & \mathrm{n} \geq 4\end{array}\right.$

International Journal of Advanced Research Trends in Engineering and Technology (IJARTET) Vol. 5,Special Issue 12, April 2018
Observation 4.8: $\mathrm{d}_{\mathrm{ntr}}\left(\overline{\boldsymbol{C}_{6}}\right)=3$

BIOGRAPHY

S. Muthammai received in M.Sc and M.Phil degree in Mathematics from Madurai Kamaraj University, Madurai in 1982 and 1983 respectively and the $\mathrm{Ph} . \mathrm{D}$ degree in Mathematics from Bharathidasan University, Tiruchirappalli in 2006. From $16^{\text {th }}$ September 1985 to $12^{\text {th }}$ October 2016, she has been with the Government Arts College for Women(Autonomous),Pudukkottai, Tamilnadu, India and she is currently the Principal, Alagappa Government Arts College, Karaikudi, Tamilnadu. Her main area research in Domination in Graph Theory.

C. Chitiravalli was born in Tholuvangadu, Pudukkottai district, Tamilnadu, India in 1990. She received the B.Sc degree in Mathematics from Bharathidasan University, Tiruchirappalli in 010 and received B.Ed degree in Mathematics from Tamilnadu Teachers Education University, Chennai in 2011. She received the M.Sc and M.Phil degree in Mathematics from Bharathidasan University, Tiruchirappalli in 2013 and 2014 respectively. She is Pursuing research in the Department of Mathematics, Government Arts College for Women(Autonomous), Pudukkottai, Tamilnadu, India. Her main area research in Domination in Graph Theory.
